

# Philadelphia Manufacturing Structure

LOCATION | Philadelphia, Pennsylvania

FACILITY TYPE | Hospital

## PROJECT BACKGROUND

Brandenburg completed demolition and environmental remediation of the former JFK Vocational School, including the main structure and storage buildings, located along the Schuylkill River in Philadelphia. Removal of the 750,000 square foot, eight-story concrete structure was part of a unique public and private combined redevelopment project.

Brandenburg began the project with asbestos removal, environmental abatement and universal/special waste handling and disposal.

Well-defined procedures and continual monitoring were carefully controlled and executed to minimize vibration, noise and dust during all phases of deconstruction.

Brandenburg crews used a selective removal process and a floor-by-floor approach to bring the structure down. In the final phase, concrete slabs and foundations were removed.

Brandenburg accelerated the project schedule and finished early to support the new construction.

## SCOPE OF WORK

Asbestos abatement

Environmental remediation

Removed, packaged and disposed of universal waste

Disconnected and removed underground utilities

Demolition of the eight-story structure and storage buildings

Removed foundation and slabs
